

IDS Press Release New FQ-system

March 2023, Lemgo

Endo finally made easy

Komet from Lemgo, Germany, have been providing the dental world with groundbreaking innovations for 100 years now. Their new FQ-system proves yet again that experience is the best foundation for innovative products.

This range continues the success story of the well-loved systems F360 and F6. The name FQ stands for flexibility and the physical symbol for heat: The instruments are made of a heat-treated nickel-titanium alloy leading to more flexibility and cyclic fatigue resistance. The variably tapered file core of the taper .06 instruments is a patented innovation granting more flexibility and a better cutting performance. The instruments do not clog and ensure an optimum preparation time.

The development of the FQ-range was based on the dentists' needs and demands. The material and the double-S cross section make the files more flexible and the treatment more efficient,

because substance is removed faster - and the risk of file fracture is reduced to a minimum. The well-planned system of instruments grants a safe, reliable and time-efficient treatment – even of difficult teeth. Users confirm that operating the FQ-system makes them feel in control and at ease. This makes the FQ-series the best choice for everyone wishing for a comfortable endo-treatment.
