

Hamaton

Hamaton Offers Commercial Vehicle Workshops First-Time Fix Solution with the Truck TPMS Starter Kit

Hamaton, a global leader in tyre pressure monitoring systems, has launched its new Truck TPMS Starter Kit. This all-in-one solution is specifically engineered to help commercial vehicle workshops and fleet operators reduce tyre service downtime and eliminate rescheduling.

In high-demand maintenance bays, realising you're missing a specific TPMS valve mid-service doesn't just stall the job - it stalls your entire operation. The Hamaton Truck TPMS Starter Kit directly addresses this challenge, helping to ensure workshops can offer a first-time fix solution for trucks, trailers, semi-trailers, coaches and buses.

The kit features a full selection of Hamaton truck TPMS valves, spare screws, and premium, nickel-plated Alcoa valves, which are engineered to prevent corrosion and ensure a perfect sensor fit. Supplied in a compartmental storage box for easy parts management and inventory checks, the kit ensures technicians have the right part for every service, whether conducting routine maintenance or emergency repairs.

Since TPMS became mandatory for newly registered commercial vehicles in 2024, TPMS servicing has quickly become standard in fleet maintenance. Just as with passenger vehicles, replacing the valve during every service is highly recommended to ensure long-term tyre pressure reliability.

Furthermore, by maintaining tyre pressure integrity throughout their fleet, operators can maximise tyre life, prevent accelerated tread wear, and minimise the risk of blowouts.

"I'm delighted Hamaton has introduced the Truck TPMS Starter Kit. I truly believe it will support garages to confidently provide rapid tyre maintenance and extend tyre lifecycles," says Martin Blakey, Managing Director. "Furthermore, TPMS servicing demonstrates a real commitment to safety and best practice across the commercial vehicle sector."
